

If you would like to manually install the Stealth Profit Machine plugin to an existing blog (because you have a Mac for example) then you can download the zip file and install it in exactly the same way as you would any other Wordpress plugin.

Step 1: Download the zip file to your computer.

Step 2: Unzip the zip file and extract the contents to a folder on your computer

Step 3: Using your FTP client software (such as Filezilla which is available free from <http://filezilla-project.org/>) upload the whole folder (including its contents) to the plugins directory of your blog.

For example, supposing your plugin is in the directory c:\download\WP Plugin\ you would then copy the whole folder stealth-profit-machine to yourdomain.com/wp-content/plugins

You may need to find the path in your FTP client such as:

/public_html/yourdomain.com/wp-content/plugins

Or

/public_html/wp-content/plugins

Depending on where you installed your blog.

Note, you do not need to copy the original zip file, but instead only the unzipped folder that was extracted from the zip file.

Step 4: Login to your Wordpress Dashboard and activate the plugin.
